The three tiers

The add-on modules

Devices

Three packages to sell

Rules you do not break

Words explained

What to charge for each of the nine modules, and how the pieces add up to a real contract.

In one minute

- The nine-module ecosystem is a much bigger product than the one priced in document 04. It needs three prices, not one.
- Tier 1 is every pregnant woman, priced per year and cheap. Tier 2 is women actively watched on a device, priced per month and roughly ten times higher. Tier 3 is the dashboards, sold to the hospital and the government.
- Two of the nine modules cannot legally be sold yet. The AI engine and the jaundice photo screening are medical devices.
- A 5,000-birth UK hospital is worth £250,000 to £490,000 a year depending on how much they buy.
- A 100,000-woman African state programme is worth about £1.4m a year, which is £14 per woman.

What to do

Action	Who	By when
Split your price list into the three tiers below	You	This week
Take the AI engine out of anything you send a buyer until it is licensed	You	Now
Replace the OMRON M7 Intelli IT with the current model, it is discontinued	You	This week
Test the three package prices on three UK maternity leads	You	Day 60
Get a cost-to-serve figure from your developer before quoting anything	Developer	Day 30

The nine modules, and what blocks each

The nine modules, and what each needs before you can sell it

Green can be sold once built. Amber needs a clinician or a partner. Red needs a medical-device licence.

1	Mother app	BP, pulse, temperature, symptoms, mood, voice diary, appointments, medication	Sell now
2	Connected devices	OMRON BP monitor, thermometer, future wearable	Sell now (resell certified kit)
3	AI engine	Maternal Instability Score, risk stratification, deterioration detection	Medical device licence
4	Clinician dashboard	Patient list, red/amber/green, graphs, timeline, escalation	Sell now if rules are the hospital's
5	Hospital dashboard	Population view, response times, performance analytics	Sell now
6	Government dashboard	Regional and national intelligence, de-identified data	Sell now
7	Baby/newborn module	Feeding, temperature, breathing, jaundice photo screening	Jaundice imaging is a device
8	Africa infrastructure	Offline, SMS, USSD, low data, multilingual	Sell now
9	Clinical integration	EPR/FHIR, secure API, access control, audit trail	Sell now

Six of the nine can be sold as soon as they are built. Two need a licence that takes years.

Two warnings before any of this reaches a buyer.

The AI engine is a medical device. "Maternal Instability Score", "risk stratification" and "deterioration detection" are the exact words that make software regulated. A UK Approved Body is likely to class this as Class IIa, the same class a clinical decision support tool reached in June 2026. That means a quality system, clinical evidence and certification before you take a penny for it. Sell the other seven modules first and treat the AI engine as the upgrade you sell in year three.

The jaundice photo screening is also a device, and the field is crowded. Picterus, BiliScreen and Bilicam already do this, and Picterus is patented out of a Norwegian university. Build it last, or licence theirs.

The three tiers

How to charge: three tiers, not one price

Everyone in the service pays a little. Women being actively watched pay a lot more. Dashboards are sold separately.

Tier 1 — Everyone

Every pregnant woman in the service. App, appointments, education, symptom log.

UK £16–£30 per woman per year

Programme £4–£9 per woman per year

Tier 2 — Watched closely

High-risk women with a blood-pressure monitor at home, actively checked.

UK £22–£38 per woman per MONTH

Programme £3–£6 per woman per month

Tier 3 — The institution

Hospital and government dashboards, analytics, integration.

Hospital £18k–£40k per site per year

Region £60k–£250k per year

Devices are always a separate line. Never hide the cost of a blood-pressure monitor inside the software price.

Everyone pays a little. Women on a monitor pay ten times more. Dashboards are sold separately.

Tier 1 — every pregnant woman

The mother app, appointments, medication reminders, education, symptom log, mood, fetal movement logging, and alerts that reach a human.

Market	Price	Note
UK hospital	£16–£30 per woman per year	Plus a site licence of £12,000–£30,000 by birth numbers
African programme	£4–£9 per woman per year	Tiered down by volume, see document 04

Tier 2 — women watched closely

A woman with high blood pressure or another risk, given a monitor to take home, whose readings are actively watched and escalated. This is the expensive part because it costs you the most to run.

Market	Price	Typical length	Value per woman
UK	£22–£38 per woman per month	16–22 weeks	£90–£190
African programme	£3–£6 per woman per month	12–20 weeks	£11–£30

Your cost to serve one UK monitored woman is roughly £6.50 a month: hosting and storage £0.30, messaging £0.40, device wear and replacement £3.00, support and safety work £2.00, logistics £0.80. That is an ESTIMATE (our best guess, not a fact) and your developer must confirm it. At £28 a month you keep about three quarters.

For comparison, American remote monitoring platforms charge \$80 to \$200 per patient per month for the software alone. You are pricing well below that, which is right for the NHS and gives you room later.

Tier 3 — the institution

What	Price	Sold to
Clinician dashboard	Included in tiers 1 and 2	Nobody buys it separately

What	Price	Sold to
Hospital dashboard	£18,000–£40,000 per site per year	The trust, by birth numbers
Government or regional dashboard	£60,000–£250,000 per year	A state ministry or an ICB, by population covered
Integration to the hospital record	£15,000–£40,000 to set up, then £4,000–£8,000 a year	The trust

The add-on modules

Module	UK price	Programme price	When you can sell it
Newborn module, without jaundice imaging	£8–£14 per birth	£1.50–£3 per birth	Once built
Voice diary, storage and playback only	£3–£5 per woman per year	£1–£2	Once built
Glucose diary for diabetes in pregnancy	£20–£30 per woman with the condition	£6–£10	After a regulatory opinion
AI engine	Add 25% to 35% to the tier 2 price	Add 20%	Only after certification
Jaundice photo screening	Not priced	Not priced	After certification, or licence someone else's

Devices

Never fold the cost of a monitor into the software price. Show it as its own line so a buyer can see what the software is worth.

Item	Your cost	What to charge
Validated upper-arm blood-pressure monitor	£55–£75 in bulk	Lease £4.50–£7 a month, or sell at cost plus 15%
Thermometer	£12–£20	Sell at cost plus 15%
Wearable watch	Rent a certified one, see document 02	£4–£7 a month

The OMRON M7 Intelli IT is discontinued by the manufacturer. It is genuinely validated for use in pregnancy including pre-eclampsia, which is why it was the right choice, but you cannot build a supply chain on a discontinued product. Move to the current OMRON model that carries the same pregnancy validation, and confirm the validation in writing with OMRON before you name it in any proposal.

Three packages to sell

Give a hospital three choices, not a menu of forty items. People buy the middle one.

Package	What is in it	5,000-birth hospital, year one
Essential	Tier 1 for everyone, tier 2 for 500 high-risk women, clinician dashboard, service plan	About £250,000
Complete	Essential plus the hospital dashboard, newborn module, one integration	About £390,000
Full ecosystem	Complete plus 1,000 monitored women, voice diary, glucose module, premium support	About £490,000

Run-rate in later years is roughly £70,000 lower once the one-off setup drops away.

Worked example: a 5,000-birth UK maternity service, Complete package

Line	Amount
Tier 1: 5,000 women at £22 plus £20,000 site licence	£130,000
Tier 2: 800 monitored women at £28 a month for 4.2 months	£94,080
Hospital dashboard	£28,000
Newborn module: 5,000 births at £10	£50,000
Integration, annual	£6,000
Software subtotal	£308,080
Service plan at 26%	£80,101
Device leases, 300 monitors in rotation at £6 a month	£21,600
One-off: setup £45,000 and integration build £25,000	£70,000
Year one total	£479,781
Run rate from year two	£409,781

That is about £96 per birth in year one and £82 a year after that. A maternity service of this size spends roughly £25m to £35m a year, so this is about 1.4% of it. Defensible, but only with evidence. Lead with Essential.

Worked example: an African state programme, 100,000 women a year

Line	Amount
Tier 1: 100,000 women at £5	£500,000
Tier 2: 15,000 monitored at £4 a month for 4 months	£240,000
Newborn module: 100,000 at £2	£200,000
Government dashboard	£120,000
Software subtotal	£1,060,000
Service plan at 28%	£296,800
Training, 30 cohorts a year	£54,000
One-off setup, year one only	£150,000
Year one total	£1,560,800

Line	Amount
Run rate from year two	£1,410,800

That is £15.60 per woman in year one and £14.10 after. Compare it to the withdrawn Ekiti proposal, which asked £300 per woman.

Rules you do not break

1. Pilot before contract. Twelve weeks, fixed price, evaluation report, and half the pilot fee credited against year one.
2. Minimum contract £40,000 in the UK and £25,000 for a programme. Below that you lose money on support.
3. Never discount below the floor price. Discount by removing modules instead.
4. Devices are always itemised separately.
5. Three-year deals get 5% off, with rises capped at inflation plus two points.
6. Nothing that needs a licence appears on a price list until you hold the licence.

Words explained

Word	What it means
Tier	A level of service. Here, how closely a woman is being watched
Cost to serve	What it costs you to look after one woman for one month
Site licence	A fixed yearly fee a hospital pays on top of the per-woman price
Run rate	What a customer pays every year after the first, once setup is done
Class IIa	A medium-risk medical device. Needs certification by an approved body before sale
Approved Body	A company licensed by the UK regulator to certify medical devices
